

A brief overview of your time management and decision making process.

Describe what you did well and not so well, and why.

What you would do if you have extra time.

First, I looked at the datasets and picked *Sentiment Analysis: Emotion in Text*. It is because I worked with sentiment and language analysis on audio-video-text data before, so it was familiar. Secondly, I went for possible techniques to use on this particular dataset and prioritized them based on the timelimit. What went well were - (a) I got to complete my planned techniques in time, (b) got deeper insights of the data (e.g., LIWC analysis). What did not go so well were - (a) Classifiers were overfitting. I have discussed these briefly in README.pdf file https://github.com/ssmumu/crowdflower_sentimentData. If I have extra time, I would have - (a) worked more on regularization of classifier, (b) applied other techniques like PCA, Kmeans.
